Gaussian distributions

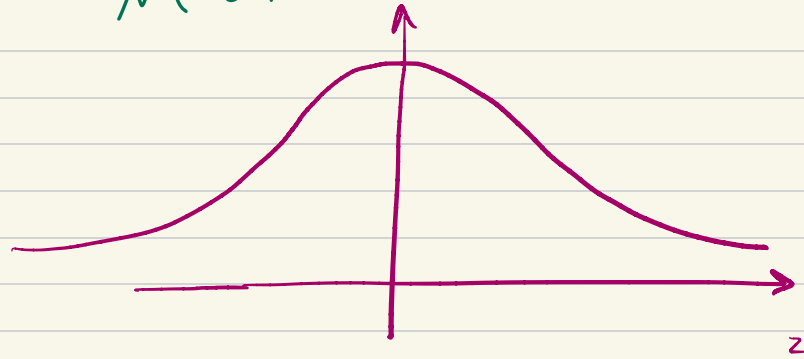

CLT

Berry Esseen Theorem

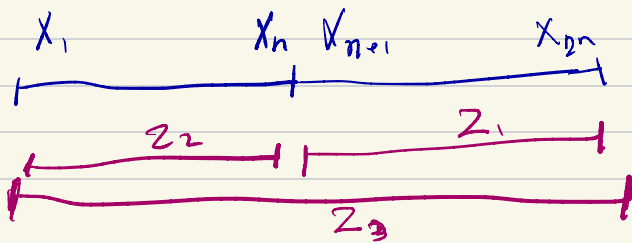

Sub-Gaussians (Next lecture)

$$\phi(z) = \text{Pr} [ Z = dz ] = \frac{e^{-z^2/2}}{\sqrt{2\pi}}$$

$N(0, \sigma^2)$  PDF

$$\begin{array}{c}
 + Z_1 + Z_2 = Z \\
 \downarrow \qquad \downarrow \qquad \searrow \\
 N(0,1) \quad N(0,1) \quad N(0,2)
 \end{array}$$

CLT

$E[X]$  and  $\text{Var}[X] < \infty$

$X_1, \dots, X_n$

$$\bar{X}_n = \frac{1}{n} \sum X_i$$

$$\frac{\sqrt{n}(\bar{X}_n - \mu)}{\sigma} \rightarrow Z$$

$N(0,1)$

$$\phi(z) = \Pr [Z = dz] = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(z-\mu)^2}{2\sigma^2}}$$

Scaling ?

$$\frac{1}{2n} \sum_{i=1}^{2n} X_i = \frac{1}{2} \left( \underbrace{\frac{1}{n} \sum_{i=1}^n X_i}_{Z_1} + \underbrace{\frac{1}{n} \sum_{i=n+1}^{2n} X_i}_{Z_2} \right)$$

---

$$+ a Z_1 + b Z_2 = Z$$

$\downarrow$   
 $N(\mu_1, \sigma_1^2)$        $\downarrow$   
 $N(\mu_2, \sigma_2^2)$        $N(a\mu_1 + b\mu_2, a^2\sigma_1^2 + b^2\sigma_2^2)$

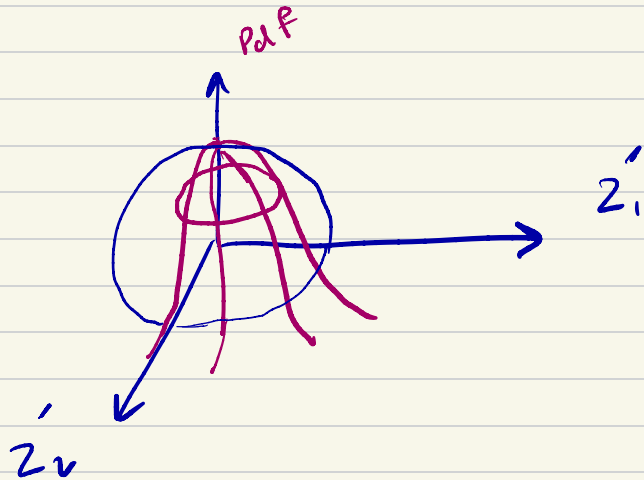

$$Z_1 = \mu_1 + \sigma_1 Z_1'$$

$$Z_1' \sim N(0, 1)$$

$$Z_2 = \mu_2 + \sigma_2 Z_2'$$

$$Z_2' \sim N(0, 1)$$

$$a Z_1 + b Z_2 = (a\mu_1 + b\mu_2) + a\sigma_1 Z'_1 + b\sigma_2 Z'_2$$

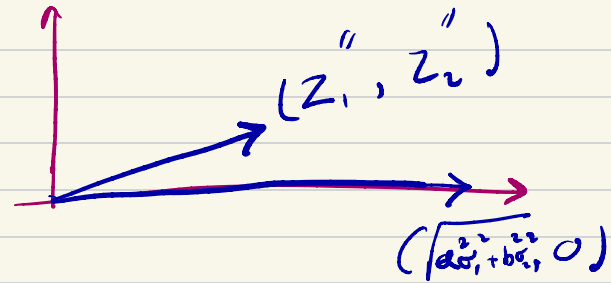

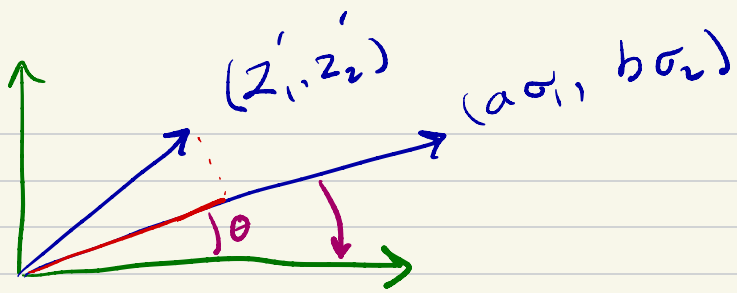

$$\text{PDF}(Z'_1, Z'_2)$$

$$= \Pr [ Z'_1 = dz'_1 \text{ and } Z'_2 = dz'_2 ]$$

$$= \frac{1}{2\pi} e^{-\frac{Z'^2_1 + Z'^2_2}{2}}$$

$$a\sigma_1 \cdot Z'_1 + b\sigma_2 \cdot Z'_2 = \langle (a\sigma_1, b\sigma_2), (Z'_1, Z'_2) \rangle$$

\*

$$\Pr [Z_1' = z_1 \text{ and } Z_2' = z_2, \text{ rotation } \theta \rightarrow z_1'', z_2'']$$

$$= \Pr [Z_1'' = z_1'', Z_2'' = z_2'']$$

$$* = \langle (\sqrt{a^2\sigma_1^2 + b^2\sigma_2^2}, 0), (z_1'', z_2'') \rangle = \sqrt{a^2\sigma_1^2 + b^2\sigma_2^2} z_1''$$

$$\Rightarrow aZ_1 + bZ_2 \sim \mathcal{N}(a\mu_1 + b\mu_2, a^2\sigma_1^2 + b^2\sigma_2^2)$$

Berry Esseen Theorem

$$E[X_i] = 0, \quad \text{Var}[X_i] = \sigma^2$$

$$S_n = (X_1 + X_2 + \dots + X_n) / n$$

$$E[Y_n] = 0, \quad \text{Var}[Y_n] = 1$$

CLT

$$E[X] \text{ and } \text{Var}[X] < \infty$$

$$X_1, \dots, X_n$$

$$\bar{X}_n = \frac{1}{n} \sum X_i$$

$$\frac{\sqrt{n}(\bar{X}_n - \mu)}{\sigma} \rightarrow Z$$

$N(0, 1)$

$$S_n \rightarrow \sqrt{n} \frac{S_n - E[S_n]}{\sigma}$$

$$\lim_{n \rightarrow \infty} \sup_t |Pr[Y_n \leq t] - \phi(t)| \rightarrow 0$$

B.E Thm:

→ CDF of  $N(0,1)$

$$\forall t: \left| \Pr [ S_n \leq t - \Phi(t) ] \right| \leq C \cdot \sum_{i=1}^n E[X_i^3]$$

$$\approx 0.5$$

$$\geq 0.01$$

Version 2

$$X_1, \dots, X_n$$

$$E[X_i] = 0 \quad E[X_i^2] = \sigma^2$$

$$E[|X_i|^3] = \rho < \infty$$

$$S_n = \frac{X_1 + \dots + X_n}{n}$$

$$\left| \Pr \left[ \frac{S_n}{\sigma \sqrt{n}} \leq t \right] - \Phi(t) \right| \leq \frac{C p}{\sigma^3 \sqrt{n}}$$

---

Example  $X_1, \dots, X_n \sim \text{Ber}(1/2)$

$$X_{i,s} \begin{cases} +1 & \text{w.p. } 0.5 \\ -1 & \text{w.p. } 0.5 \end{cases}$$

$$\begin{aligned} \text{Var}[\text{Ber}(1/2)] &= p(1-p) \\ &= \frac{1}{4} \\ &= \sigma^2 \end{aligned}$$

$$p = 1/2$$

$$S_n = \frac{\#(+1) - \#(-1)}{n}$$

$$\Pr \left[ \frac{\#(+1)}{n} \geq \frac{1}{2} + \varepsilon \right] =$$

$$\Pr \left[ \#(+1) \geq \frac{n}{2} + \varepsilon \cdot n \right] =$$

$$\Pr \left[ \#(+1) \geq \frac{\#(+1) + \#(-1)}{2} + \varepsilon n \right] =$$

$$\Pr \left[ \frac{\#(+1) - \#(-1)}{2} \geq \varepsilon n \right]$$

$$= \Pr \left[ \frac{S_n \cdot n}{2} \geq \varepsilon n \right] = \Pr [ S_n \geq 2\varepsilon ]$$

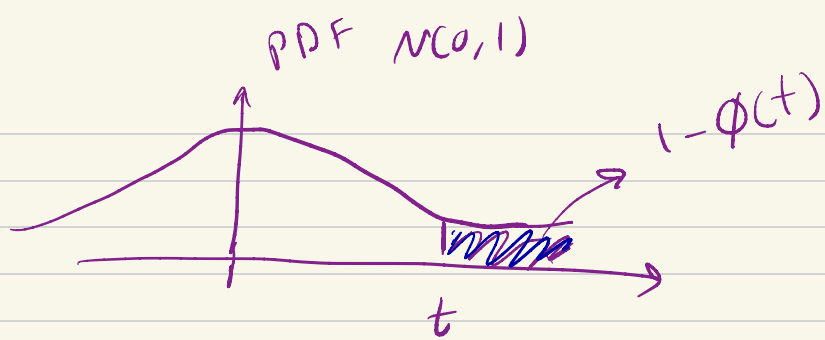

$$= \Pr \left[ \frac{S_n \sqrt{n}}{\sigma} \geq \frac{2\varepsilon \sqrt{n}}{\sigma} \right]$$

$$\underbrace{\hspace{15em}}_A \quad \underbrace{\hspace{10em}}_{\Pr[Z \leq t]}$$

B-E:

$$\left| A - \underbrace{(1 - \Phi(t))}_{0.05} \right| \leq \frac{C \cdot E[|X_i|^3]}{\sigma^3 \sqrt{n}} \leq \frac{0.5 \cdot 1}{\frac{1}{8} \sqrt{n}}$$

$$\left| A - 0.05 \right| \leq 0.000001 \approx O\left(\frac{1}{\sqrt{n}}\right)$$

$$t \cdot \boxed{\phantom{x}} = \int_{z=t}^{\infty} t \cdot \phi(z) dz$$

$$\leq \int_{z=t}^{\infty} z \phi(z) dz = -\phi(z) \Big|_t^{\infty}$$

$$= \underbrace{-\phi(\infty)}_0 + \phi(t) = \phi(t)$$

$$\begin{aligned} \frac{d\phi(z)}{dz} &= \frac{d}{dz} \left( \frac{1}{\sqrt{2\pi}} e^{-z^2/2} \right) \\ &= \frac{1}{\sqrt{2\pi}} e^{-z^2/2} \cdot (-z) \\ &= -\phi(z) \cdot z \end{aligned}$$

$$\text{area} = \Pr [Z \geq t] \leq \frac{\phi(t)}{t} \approx \frac{e^{-t^2}}{t}$$

$$\left( \frac{1}{t} - \frac{1}{t^3} \right) \cdot \phi(t) < \Pr [Z \geq t] \leq \frac{\phi(t)}{t}$$

$$\Pr [Z \geq t] \leq e^{-t^2/2}$$
